# 2017 SANTA PAULA BASIN ANNUAL REPORT

(UWCD PROFESSIONAL PAPER 2019-01)

---

## FOREWORD

---

In March 1996, the Superior Court of the State of California for the County of Ventura entered a stipulated judgment to establish pumping allocations and establish a management plan for the Santa Paula groundwater basin (*United Water Conservation District vs. City of San Buenaventura*, original March 7, 1996, amended August 24, 2010 [hereinafter “Judgment”]). Members of the Santa Paula Basin Pumpers Association (SPBPA) and the City of San Buenaventura exercise rights to pump groundwater from the basin for reasonable and beneficial uses. United Water Conservation District (UWCD, or United) does not produce groundwater from the basin, but the basin is located within its boundaries and United is authorized to engage in groundwater management and replenishment activities and to commence actions to protect the water supplies which are of common benefit to the lands within the UWCD or its inhabitants.

The Judgment provides for the creation of a Santa Paula Basin Technical Advisory Committee (TAC) with equal representation from United, the SPBPA, and the City of San Buenaventura. The TAC is charged with establishing a program to “monitor conditions in the basin, including but not necessarily limited to verification of future pumping amounts, measurements of groundwater levels, estimates of inflow to and outflow from the basin, increases and decreases in groundwater storage, and analyses of groundwater quality.” The Judgment also allows for the development of a management plan for the operation of the basin and empowers the TAC to determine the safe yield of the basin.

The Judgment requires annual reports summarizing results of the monitoring program, and further specifically provides that “United Water Conservation District shall have the primary responsibility for collecting, collating, and verifying the data required under the monitoring program, and shall present the results thereof in annual reports to the Technical Advisory Committee.” United submits the draft annual reports to the TAC members for review, comment, and approval. The primary groundwater management objective in the Santa Paula basin is to ensure that production from the basin does not exceed the long-term sustainable yield of suitable-quality groundwater for current and anticipated future uses (i.e., municipal, domestic, agricultural, and industrial). The TAC’s specialty studies and annual monitoring reports provide data and analysis intended to support this objective.

In 2010 the Judgment was amended to join various pumpers that were not previously included as parties to the settlement, and to clarify certain provisions pertaining to shortage conditions, the

responsibilities of the SPBPA and groundwater production by its members, and water-rights transfer procedures. Also in 2010, a Santa Paula Basin TAC Working Group was established consisting of technical experts from United, the SPBPA, and the City of San Buenaventura. Since its formation, the Working Group has completed a series of specialty studies to better understand the factors that affect safe yield in the Santa Paula basin, including a revised safe-yield study in 2017. In addition, the Working Group will continue to conduct future studies to complement the 2017 Safe-Yield Study. The Working Group is currently evaluating metrics (“triggers”) that will be used to evaluate whether and to what extent the basin might be negatively affected by future pumping and considering options to enhance safe yield of the basin.

In 2014, legislation (AB 1739, SB 1168 and SB 1319) was enacted by the State of California requiring every groundwater basin in California to be managed sustainably by the year 2042. These three bills are collectively known as the Sustainable Groundwater Management Act (SGMA). Groundwater basins that have had their water rights adjudicated, such as the Santa Paula basin, are exempt from some SGMA requirements but do have new requirements to report basin conditions to the California Department of Water Resources (DWR). The data presented in this Annual Report will be submitted to DWR (using their online reporting tool) as required to meet the SGMA requirements for adjudicated basins.

# 2017 SANTA PAULA BASIN ANNUAL REPORT

(UWCD PROFESSIONAL PAPER 2019-01)

---

## INTRODUCTION

---

This is the twenty-first annual report presenting key climatic, hydrologic, and hydrogeologic data to support management of groundwater resources in the Santa Paula basin. Relevant geographic features in and near the Santa Paula basin are shown on Figure 1. Data for calendar-year (CY) and water-year (WY) 2017 (the reporting period) are included in this report. This annual report provides the TAC—which consists of representatives from United Water Conservation District (UWCD or United), the City of San Buenaventura (Ventura), and the Santa Paula Basin Pumpers Association (SPBPA)—with monitoring results and other data to be used for management of the basin in accordance with the 1996 Santa Paula basin stipulated judgment by the Superior Court of the State of California for the County of Ventura (*United Water Conservation District vs. City of San Buenaventura*, original March 7, 1996, amended August 24, 2010 [hereinafter “Judgment”]) and with requirements for adjudicated basins under the Sustainable Groundwater Management Act (SGMA). This report summarizes annual precipitation, streamflow, surface water quality, production well installations and destructions, groundwater extractions and pumping allocations, groundwater levels, change in groundwater storage, and groundwater quality data obtained by United for the Santa Paula basin during the reporting period. Sources of the monitoring data and methods of their collection are unchanged from those described in the 2015 Santa Paula Basin Annual Report (United, 2017a); refer to that document for details regarding the sources and methods.

---

## DATA SUMMARY AND EVALUATION

---

Key hydrologic indicators for Santa Paula basin during the reporting period are summarized and compared to long-term averages in Table 1, below. More detailed information regarding conditions in Santa Paula basin during the reporting period are provided in the following subsections.

**Table 1. Key Hydrologic Indicators in Santa Paula Basin**

Hydrologic Indicator	2017	Average During Period of Record	Median During Period of Record	Period of Record
Water-Year <sup>a</sup> Precipitation at Santa Paula-UWCD <sup>b</sup> (inches)	21.65	17.19	14.89	1890 through 2017
Calendar-Year Precipitation at Santa Paula-UWCD <sup>b</sup> (inches)	16.73	17.00	15.48	1890 through 2017
Water-Year Discharge in Santa Clara River at Freeman Diversion <sup>b</sup> (AF/yr)	98,800	206,900	114,000	1956 through 2017
Water-Year Discharge in Santa Paula Creek at Mupu Bridge <sup>b</sup> (AF/yr)	15,200	18,000	8,200	1928 through 2017
Reported Calendar-Year Groundwater Extractions in Santa Paula Basin (AF/yr)	21,889	25,660	25,932	1980 through 2017
Groundwater Level Index (ft msl)	175.06	181.02	181.82	1983 through 2017
Change in Groundwater Storage from Previous Year (AF)	+50 to +500	Not applicable	Not applicable	spring 2016 to spring 2017

Notes:

<sup>a</sup> A water year (WY) is defined as the period from October 1 of the previous year through September 30 of the year indicated. For example, WY 2017 includes the period from 10/1/2016 through 9/30/2017.

<sup>b</sup> Locations and identification numbers for rain and stream gages are indicated on Figure 1.

## PRECIPITATION

Annual precipitation at Saticoy and Santa Paula throughout the period of record is shown on Figures 2 and 3; monthly precipitation at these locations during CY and WY 2017 is shown on Figure 4. Appendix A (Table A-1) includes a tabulation of monthly precipitation at Santa Paula-UWCD during the period of record. It should be noted that CY (and WY) 2017 was the first year with above-average precipitation following the driest 5-year period on record in Santa Paula (WYs and CYs 2012 through 2016). As shown on Figure 4, much of the precipitation occurring in CY and WY 2017 fell in just two months, January and February.

## SURFACE WATER FLOWS

Annual discharge in the Santa Clara River (at Freeman Diversion) and Santa Paula Creek (near Santa Paula) throughout the period of record is shown on Figures 5 and 6; daily streamflow at these locations during CY and WY 2016 is shown on Figure 7. Appendix A (Tables A-2 and A-3) provides annual total discharge in the Santa Clara River and Santa Paula Creek during the period of record. Annual discharge during WY 2017 in the Santa Clara River at Freeman Diversion was about half the long-term average volume, and discharge in Santa Paula Creek near Santa Paula was slightly below average.

## SURFACE WATER QUALITY

Minimum, maximum, and average concentrations of selected major water quality constituents (chloride, nitrate, total dissolved solids [TDS], and sulfate) detected in surface water samples from the Santa Clara River at Freeman Diversion during CY 2017 are summarized in Table 2, below. Concentrations of these constituents detected throughout the period of record are shown on Figure 8. Table 2 indicates that average concentrations of chloride, nitrate, TDS, and sulfate detected in the Santa Clara River during CY 2017 were somewhat higher than long-term average concentrations, except for nitrate (which was less than the long-term average concentration).

**Table 2. Summary of Major Surface Water Quality Parameters in Santa Clara River at Freeman Diversion, CY 2017**

Statistic	Concentration, milligrams per liter (mg/L)			
	Chloride	Nitrate <sup>a</sup>	TDS	Sulfate
CY 2017 Minimum	28	Less than 0.4	390	190
CY 2017 Maximum	166	8.0	2,080	1,150
CY 2017 Average	84	3.9	1,310	680
Long-Term Average <sup>b</sup>	64	5.9	1,130	530

Notes:

<sup>a</sup> As nitrate ( $\text{NO}_3$ )

<sup>b</sup> Includes reported data in United's database from the entire period of record, beginning in CY 1925 for chloride, TDS, and sulfate; beginning in CY 1936 for nitrate.

Minimum, maximum, and average concentrations of selected major water quality constituents (chloride, nitrate, TDS, and sulfate) detected in surface water samples from Santa Paula Creek near Santa Paula during CY 2017 are summarized in Table 3, below. Concentrations of these

constituents detected throughout the period of record are shown on Figure 9. Table 3 indicates that average concentrations of chloride, nitrate, TDS, and sulfate detected in Santa Paula Creek during CY 2017 were higher than long-term average concentrations, similar to trends in the Santa Clara River (with the exception of nitrate).

**Table 3. Summary of Major Surface Water Quality Parameters in Santa Paula Creek near Santa Paula, CY 2017**

Statistic	Concentration (mg/L)			
	Chloride	Nitrate <sup>a</sup>	TDS	Sulfate
CY 2017 Minimum	32	5.7	800	330
CY 2017 Maximum	80	20	1,240	560
CY 2017 Average	61	11	1,010	450
Long-Term Average <sup>b</sup>	44	9.6	810	370

Notes:

<sup>a</sup> As nitrate ( $\text{NO}_3^-$ )

<sup>b</sup> Includes reported data in United's database from the entire period of record: CY 1980 to present for hardness, sulfate and chloride; CY 1981 to present for nitrate.

## PRODUCTION WELL INSTALLATIONS AND DESTRUCTIONS

One production well was replaced within the Santa Paula basin during CY 2017, as listed in Table 4, below. The new production well was a replacement for an existing production well.

**Table 4. Production Well Installations and Destructions During CY 2017**

Production Wells Destroyed	Production Wells Drilled
02N22W03K03S, Tucker Ranch	02N22W03K05S, Tucker Ranch (replacement for 02N22W03K03S)

## GROUNDWATER EXTRACTIONS

Annual groundwater extractions (pumping) reported for Santa Paula basin wells throughout the period of record are summarized in Table 5, below, and illustrated on Figure 10.

**Table 5. Historical Santa Paula Basin Groundwater Extractions**

Calendar Year	Groundwater Extractions (AF)	Calendar Year	Groundwater Extractions (AF)	Calendar Year	Groundwater Extractions (AF)
1980	26,820	1993	26,998	2006	24,830
1981	27,545	1994	26,244	2007	28,077
1982	22,925	1995	25,042	2008	26,686
1983	16,710	1996	26,008	2009	25,820
1984	29,455	1997	28,961	2010	23,115
1985	26,533	1998	21,622	2011	24,202
1986	21,617	1999	27,700	2012	25,824
1987	24,852	2000	26,798	2013	26,485
1988	25,370	2001	22,530	2014	27,437
1989	29,362	2002	27,259	2015	25,856
1990	33,453	2003	22,280	2016	25,363
1991	27,056	2004	27,306	2017	21,889
1992	24,355	2005	24,700		
				Average	25,660
				Median	25,932
Note: The groundwater extractions shown on this table are based on semi-annual groundwater production statements submitted to United's Finance Department.					

Reported groundwater extractions from the Santa Paula basin during CY 2017 by the City of San Buenaventura, members of the SPBPA, and other pumpers are summarized in Table 6, below. The Judgment governs groundwater production on a seven-year rolling average, which allows parties to produce more or less than their allocation in any particular year so long as their rolling seven-year average does not exceed their allocation. Appendix D summarizes groundwater extractions for the past seven years (CYs 2011 through 2017), as well as Individual Party Allocations (IPAs) for the SPBPA (with transfers, de minimis parties, non parties) and the City of San Buenaventura.

**Table 6. Summary of Groundwater Extractions During CY 2017**

Pumper	Extractions (AF)
City of San Buenaventura <sup>a</sup>	2806
SPBPA Pumpers with Individual Party Allocations (adjusted by SPBPA) <sup>b</sup>	19,042
SPBPA Pumpers with Individual Party Allocations (reported to United) <sup>c</sup>	19,042
Non-stipulated Parties <sup>b</sup>	19
De Minimis Pumpers <sup>b</sup>	23
Total extractions (adjusted by SPBPA <sup>b</sup> / reported to United <sup>c</sup> )	21,889 / 21,889
Notes:	
<sup>a</sup> Includes pumping from well 02N/22W-03E01S (Appendix D, Table D-5)	
<sup>b</sup> From Appendix D, compiled by SPBPA	
<sup>c</sup> From UWCD Finance Department records	

Reported groundwater extractions during CY 2017, together with estimated imports and exports, are summarized by use and source in Table 7 and graphically illustrated Figure 11. The distribution of groundwater extractions across the basin during CY 2017 is shown on Figure 12.

**Table 7. Summary of Groundwater Extractions, Imports, and Exports in Santa Paula Basin, CY 2017**

<b>Description</b>	<b>Volume (AF)</b>
Reported groundwater extractions from wells in the Santa Paula basin stipulated area	21,889
Estimated groundwater imports from Fillmore basin (assume 60% of total pumpage from Teague #6 and 100% from FICO #12)	+4,192
Estimated groundwater imports from Oxnard Forebay basin (assume 67% of total pumpage from Alta #3 and Alta #11)	+813
Estimated water exports to Mound basin via the FICO distribution system	-802
<b>Estimated net groundwater use in Santa Paula basin (sum of extractions plus imports, less exports)</b>	<b>= 26,092*</b>

\* Does not include potential imports/exports by Ventura to/from other supply sources. Specific volumes of groundwater exported from Ventura's wells in Santa Paula basin, and imported from other sources to the Santa Paula basin, are variable and undetermined. However, the net import or export of water by Ventura to/from Santa Paula basin can be assumed to be relatively small compared to the overall water budget.

## GROUNDWATER LEVELS

Groundwater elevations were monitored during the reporting period at selected wells in and adjacent to the Santa Paula basin, shown on Figure 13. Groundwater elevation hydrographs for selected wells are provided in Appendix B. Two hydrographs are included for each well at different scales, as follows:

- The first hydrograph for each well is scaled with a consistent vertical axis range of -60 to 380 feet so that, for most wells, the relationships between static groundwater levels, top and bottom of well screens, and reference points (RPs) at different wells in the basin can be visually compared. The information provided in these hydrographs displays the relationship between the (static) water level variations and the production zones of wells in the basin.
- The second hydrograph for each well is scaled to allow easier comparison of the magnitude of the static groundwater level changes in the wells. The vertical axis range of 80 feet captures the range of water levels on an expanded scale for visual inspection of groundwater level trends and comparison between wells. These plots include annotations regarding the RP and depth of the screen (which is indicated in parentheses to the right of the well number) at each well.

Groundwater elevation contours for spring and fall of CY 2017 in Santa Paula basin are shown on Figures 14 and 15. The contours were interpolated using groundwater elevation data obtained from wells in the Santa Paula basin and in the adjacent, hydraulically-connected Fillmore, Mound, and Oxnard Forebay basins. The contours represent lines of equal groundwater elevation (total hydraulic head), and generally define the water table (in unconfined portions of the aquifer) or potentiometric surface (in confined portions of the aquifer). Most of the groundwater elevations used for contouring were measured at long-screened wells with total depths greater than 100 feet. The screened interval contoured at United's cluster monitor well sites SP-1 and SP-2 are 370-390 feet below ground surface (bgs), and 290-310 feet bgs, respectively. Groundwater elevations measured at shallow versus deep wells are not contoured independently in this annual report.

Groundwater levels in most wells throughout the basin show a seasonal variation in the range of 10 to 20 feet. Longer-term groundwater level trends have been summarized in Santa Paula basin through the use of a "groundwater level index" (GLI). The GLI is calculated as the average of spring-high groundwater elevations measured each year at nine key wells selected for their relatively long record and their geographic distribution across the basin. This data is included in Appendix B. The GLIs for CYs 1983 through 2017 are shown on Figure 16, together with the cumulative departure from average precipitation over the same period at Santa Paula-UWCD. The CY 2017 GLI is 175.06 feet above mean sea level (ft msl), which is about 11 feet higher than the previous year's GLI (a record low 164.17 ft msl). Calculation of the CY 2017 GLI was affected by the destruction of one of the index wells in 2017. Due to its location in the western part of Santa Paula basin, well 03N21W34R01S typically had lower groundwater elevations than most of the other index wells. Therefore, the GLI increased in 2017 partly because the average groundwater elevation for the remaining wells is simply higher than the average when well 03N21W30F01S is included. This artifact likely accounted for approximately 5 feet of the apparent increase in GLI between 2016 and 2017. The average GLI since 1983, when it was first calculated, is 181.20 ft msl, which is approximately 6 feet above the 2017 GLI. So it can be concluded that water levels rose in 2017.

## CHANGE IN GROUNDWATER STORAGE

---

Geostatistical analysis of year-over-year changes in spring-high groundwater elevations within the Santa Paula basin indicates that, on average, groundwater levels rose by 3.58 ft across the basin from spring 2016 (see UWCD, 2017b) to spring 2017 (Figure 17; Appendix C). This rise is smaller than the increase in GLI of 11 feet that occurred from spring 2015 to spring 2016, as discussed in the previous section. More data points are used for the geostatistical analysis than for the GLI calculation; therefore, the geostatistical analysis likely is more representative of basinwide groundwater-elevation and storage changes from year to year.

The magnitude of the geostatistically-calculated change in storage was based solely on data from wells where groundwater levels were measured both during spring 2016 and spring 2017 in and adjacent to Santa Paula basin. The Kriging method was used to interpolate the estimated groundwater elevation changes across the area of the unconsolidated alluvial deposits in and adjacent to Santa Paula basin. Areas outside of the basin were then “blanked,” removing them from the calculation of average groundwater level change. The area of the unconsolidated alluvial deposits within Santa Paula basin is approximately 13,000 acres, and the average storage coefficient for the aquifer, which is mostly confined, is estimated to be in the range from 0.001 to 0.01. Based on these known data and estimated parameters, the calculated change in groundwater storage within the area of the unconsolidated alluvial deposits between spring 2016 and spring 2017 is an increase of 50 to 500 AF, which may be within the margin of error for the method of analysis.

## GROUNDWATER QUALITY

Concentrations of selected water-quality constituents (nitrate, chloride, sulfate, and TDS) detected in groundwater samples obtained during CY 2017 and reported to United are summarized in Table 8, below, together with California primary maximum contaminant levels (MCLs), secondary MCL ranges (MCLRs), and water quality objectives specified by the California Regional Water Quality Control Board, Los Angeles region (1994). Maps showing the maximum reported concentrations of these constituents during CY 2017 are provided on Figures 18 through 21. As noted in past annual reports, concentrations of chloride, TDS, and sulfate generally increase from east to west in the basin.

**Table 8. Summary of Chloride, Nitrate, TDS, and Sulfate in Groundwater in Santa Paula Basin, CY 2017**

Statistic	Concentration (mg/L)			
	Chloride	Nitrate <sup>a</sup>	TDS	Sulfate
CY 2017 Minimum	25	ND	812	277
CY 2017 Maximum	304	35	3,910	1,900
CY 2017 Average	66	9.3	1,350	566
Long-Term Average <sup>b</sup>	69.8	10.3	1,309	540
Primary MCL	none	45	none	none
Secondary MCLR-“Recommended”	250	none	500	250
Secondary MCLR-“Upper”	500	none	1,000	500
Water Quality Objectives East/West of Peck Rd.	100/110	45/45	1,200/2,000	600/800

Notes:

ND = not detected  
MCL = Maximum Contaminant Level  
MCLR = Maximum Contaminant Level Range

<sup>a</sup> As nitrate ( $\text{NO}_3^-$ )

<sup>b</sup> Includes reported data in United’s database from the entire period of record: CY 1903 to present for chloride, TDS, and sulfate; CY 1923 to present for nitrate.

Reported concentrations of hardness, alkalinity, iron, and manganese for groundwater samples obtained during CY 2017 are summarized in Table 9, together with the secondary MCLs for iron

and manganese, and the micro-irrigation plugging hazard criteria developed by Pitts and Peterson (undated) and the University of California (2015). Iron and manganese occur naturally in groundwater, and any elevated concentrations detected in the Santa Paula basin are thought to be a result of local geochemical conditions rather than man-made sources (e.g. mining or industrial discharges).

**Table 9. Summary of Hardness, Alkalinity, Iron, and Manganese in Groundwater in Santa Paula Basin, CY 2017**

Statistic	Concentration (mg/L)			
	Hardness <sup>a</sup>	Alkalinity <sup>a</sup>	Iron	Manganese
CY 2017 Minimum	397	180	ND	ND
CY 2017 Maximum	1,240	380	1.18	0.82
CY 2017 Average	631	256	0.09	0.27
Long-Term Average <sup>b</sup>	647	270	0.15	0.24
Secondary MCL	NA	NA	0.3	0.05
Pitts and Peterson Plugging Hazard Potential	Moderate	150-300	100-200	0.1 - 1.0
	Severe	>300	>200	>1.0
Univ. of Calif. Clogging Potential	Moderate	NA	100	0.2 - 1.5
	Severe	NA	NA	>1.5

Notes:

ND = not detected

NA = not applicable or not reported

> = greater than the value shown

<sup>a</sup> As calcium carbonate (CaCO<sub>3</sub>).

<sup>b</sup> Includes reported data in United's database from the entire period of record: CY 1929 to present for hardness and alkalinity; CY 1937 to present for iron and manganese.

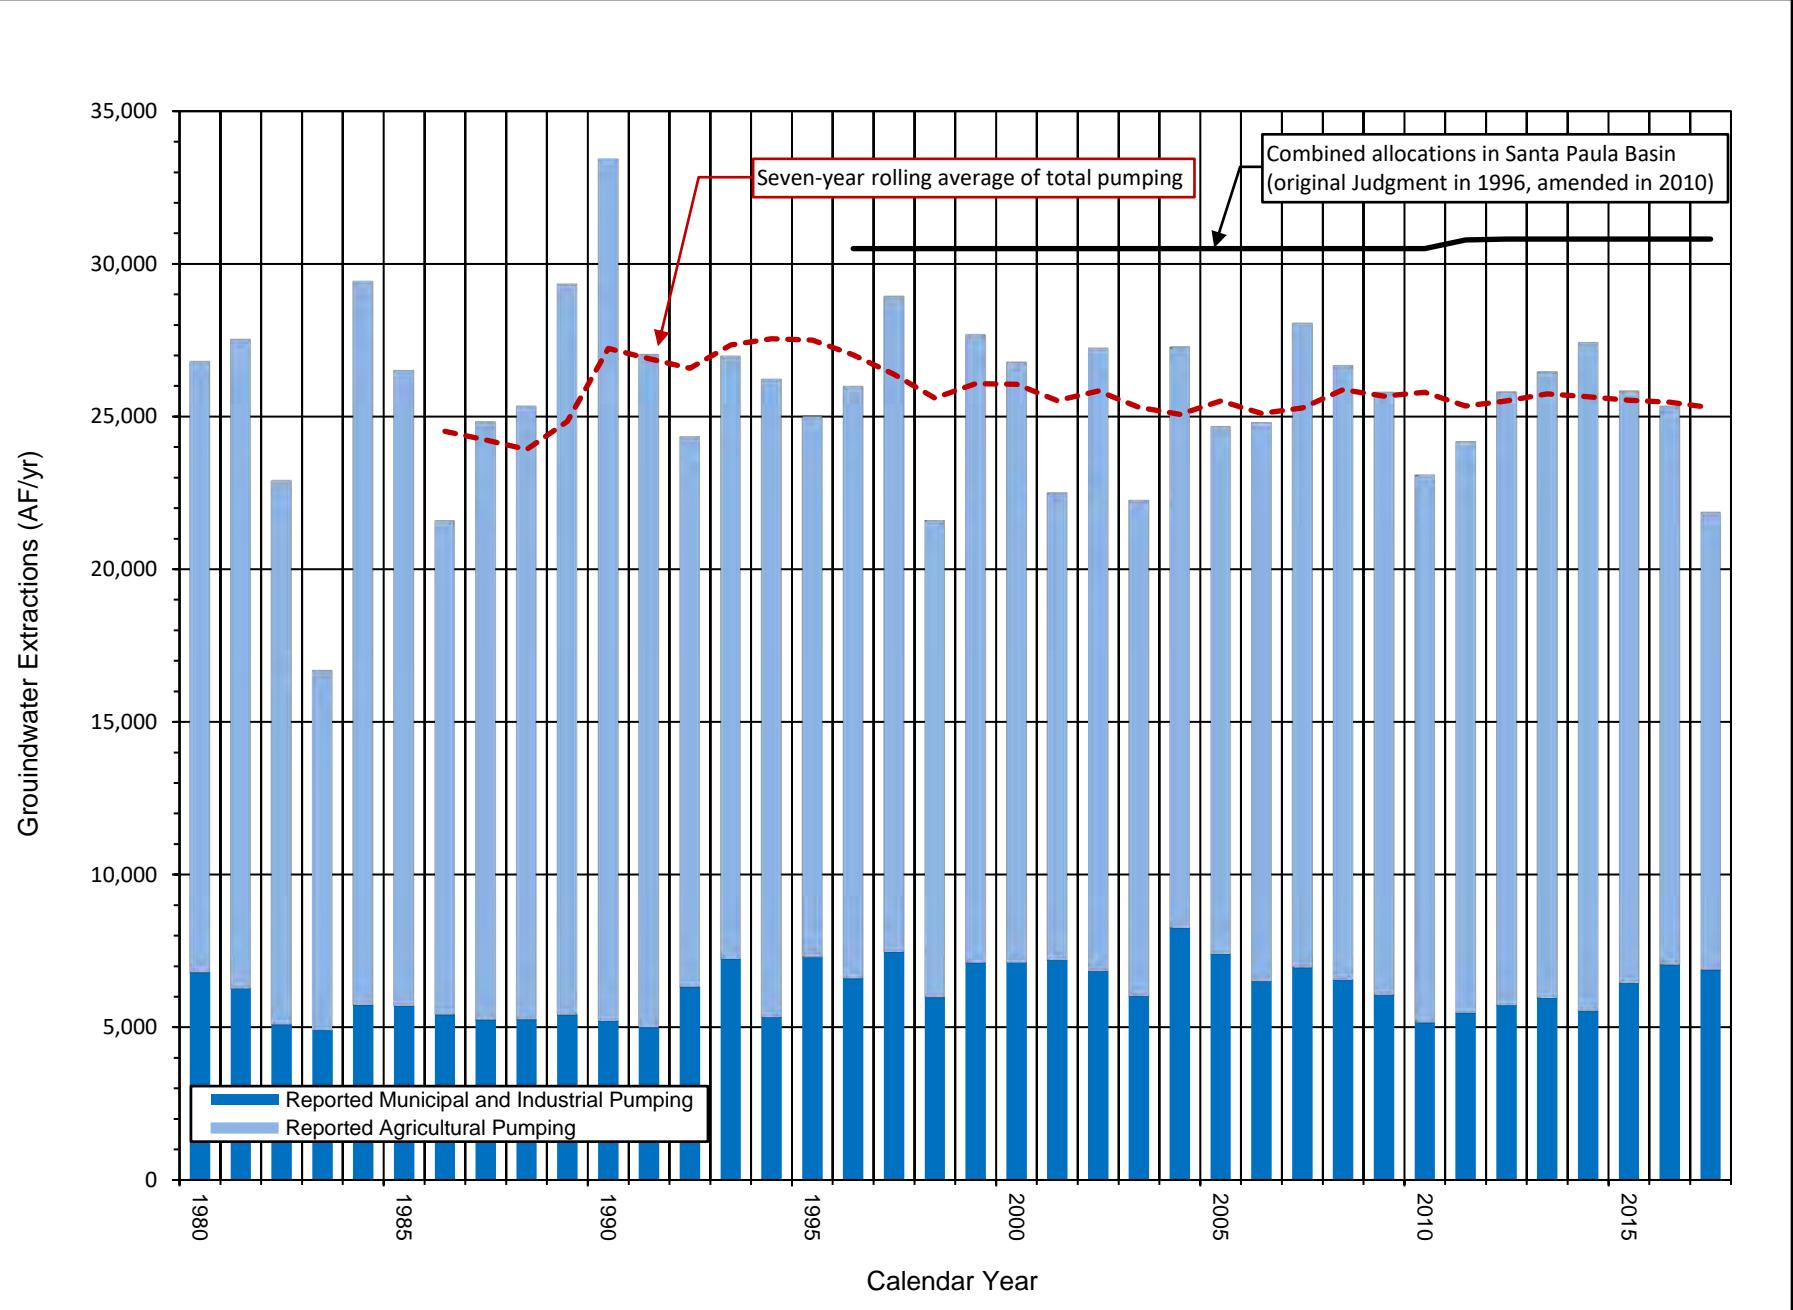

Figure 10. Historical Annual Groundwater Extractions from Santa Paula Basin, CYs 1980 through 2017

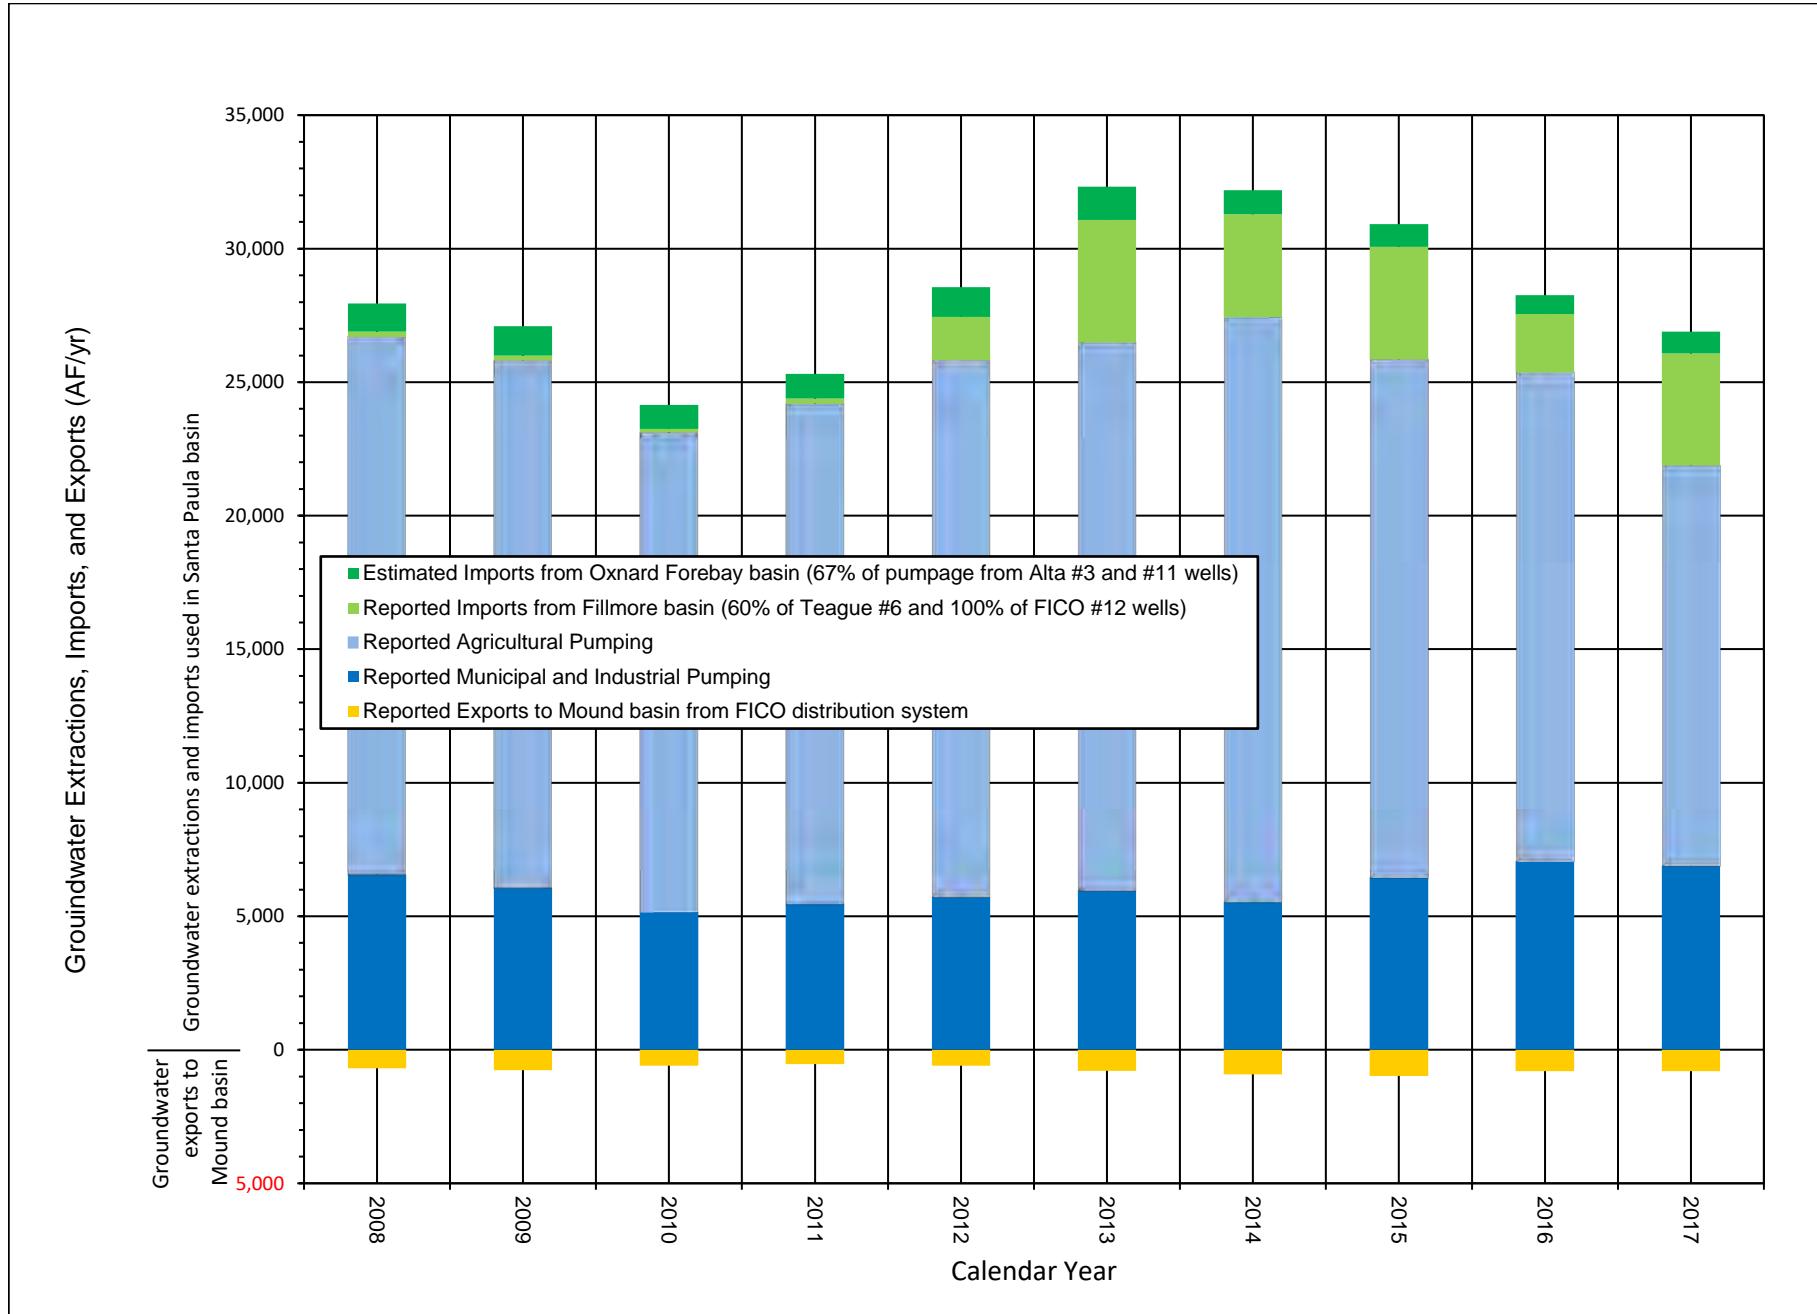

Figure 11. Annual Groundwater Extractions, Imports, and Exports from Santa Paula Basin, CYs 2008 through 2017

### Legend

- Santa Paula Basin Settlement Boundary
- Limits of Unconsolidated Alluvial Deposits in Santa Paula Basin
- Incorporated Cities or Towns
- Public Land Survey System (Township, Range and Section)

### Reported 2017 Pumping within Santa Paula Basin Settlement Boundary

- Zero
- Less than 10
- 10 to 50 AF
- 50 to 250 AF
- 250 to 500 AF
- 500 to 1,000 AF
- Greater than 1,000

1 0.5 0 1 2 Miles

Notes: "TOPPERF" and "BOTPERF" are top and bottom, respectively, of the screened interval of the well, in feet below land surface.

Values of "0" are inserted where the top or bottom of the screened interval was not reported.

"WLESpring2017" and "WLESpring2016" are springtime-high groundwater elevations measured in the well, in feet above mean sea level.

"Difference" is the change in groundwater elevations measured in the well between spring of the previous year to spring of the reporting period, in feet.

(1) Albert and Mary Casteneda (03N21W19L01S) used the UWCD crop factor estimating 2011 production at 271.25 ac-ft. Subsequent to 2011 they installed a water meter which indicates that their production is likely much lower. The SPBPA then lowered their 2011 production by 186.25 ac-ft to 85 ac-ft which they feel more accurately reflects 2011 production. UWCD does not accept the reduction of the 2011 production for Albert and Mary Castaneda as they did not have a meter installed in 2011.

(2) Source of production data for 2011, 2012, 2013, 2014, 2015, 2016 and 2017 was the United Water Conservation District, reviewed by the Association.

(3) Ortiz-Trust – Joseph and Sons (03N21W30E01S, 03N21W30E02S, 03N21W20H01S) according to the SPBPA used the wrong meter readings and over reported 2011 production by 131.08 ac-ft . UWCD accepts only 63.8 ac-ft the reduction of the 2011 production for Ortiz Trust-Joseph and Sons for a total 2011 production of 159.68 ac-ft .

(4) Shared well among Bender Realty LTD, Santana, Jamie L. and McGaelic Group. Production is split in accordance with each parties metered use.

(5) Shared well need to determine how to allocate production between Santana and Pinkerton, Arlene.

(6) G. Dominguez was a listed non-party in the original Judgment and the 0.9 acre-feet has been removed from this list reducing the total by 0.9 acre-feet.

(7) Well number 3N/21W-30H3 should be changed to 3N/21W-30H5.

(8) Newbasis is the reporting party, Utility Vault is parent.

(9) Shared well allocated 356.0 AF/Year of production for 2007 to 2013 between City of San Buenaventura and Hadley Williams Partnership by 64/36% of allocation, production meter should be installed to allocate produced water.

## Table "D-1"

### IPA's 2011 - 2017 Production & Averages

3/22/2019

2011 (2)	2012 (2)	2013 (2)	2014 (2)	2015 (2)	2016 (2)	2017 (2)	7 Year Average	Avg Over + Under (-)	Acre Feet	Party Name	Well Number
-------------	-------------	-------------	-------------	-------------	-------------	----------	-------------------	-------------------------	-----------	------------	-------------

(10) Well number was added Oba.

(11) Deleted

(12) Source of well productin data for 2009: United Water Conservation District 2009SPbasinbywell.xls

(13) Shared well (3N/22W-24R01) between Leavens Ranches and Jamie Santana Family Trust. Production is reported separately.

(14) Deleted

(15) Spelling correction

(16) Deleted

(17) Roger Clow is a 1/3 owner of the Shores well; however, Clow used 100% of the water for 2007 and 2008. Clow's usage totals 30.5 AF for 2007 and 61 AF for 2008 were reallocated from Shores.

(18) Deleted

(19) Bender Reality 2010 production (03N21W16P02S, 03N21W16P03S) has been reduced by the SPBPA from 1,356.63 ac-ft (UWCD records) to 532.7 ac-ft for a reduction of 823.93 ac-ft. UWCD does not accept the reduction of the 2010 production of Bender Reality as no documentation was presented to UWCD within 6 month adjustment period.

(20) Deleted

(21) Michael Fiano stipulated in 2012 and will be leasing all water pumped annually going forward, transfers to date have been estimated and any remaining balances will be made current with 2014 recorded production.

(22) Bratcher Cutright IPA From Bender Farms, 6 acre-feet

(23) Bender Reality and Bender Farms are owned by the same person, Bender Farms transferred 4.6 AF to the City of Santa Paula in 2012 and 6.0 AF to Bratcher in 2014, minus numbers reflect remaining allocation for prior years, plus Bratcher reported production for the years reported to United Water Conservation District.

(24) Basso Properties Sold to Jaime Santana Trust 43.4 acre-feet with property

(25) Roger Orr as Trustee of the Orr Family Trust so the Orr Ranch Co. to Bryce R. and Elaine V. Bannatyne Co Trustees of the Bannatyne Trust

(26) County of Ventura over reported 158.62 acre-feet in 2013, (331.2+2.67-158.62=175.2) United Water Conservation Distrct did not recognize that production correction in their records.

(27) Pinkerton, W. J. Estate Ranch 1 & 2, Sold to Pinkerton W. J. Estate Ranch 158.7 AF of IPA and 132.5 AF of IPA to TVC Pinkerton Ranch LLC in 2014, combined over production is reflected on TVC Pinkerton

(28) The Judson T. Cook & Suzette H. Cook Revocable Trust dated December 5, 2007 Purchased the Dabney, George and Rebecca Trust Inter Vivos in January 2017

(29) Bender Reality and Bender Farms sold property to JKJ Farms LLC with 225 acre-feet of allocation and JKJ later transferred 100 acre-feet to Brucker Family Trust

(30) Wittenberg-Livingston, Inc. sold 4 acre-feet to Little Clara Ranch and 20.8 acre-feet to Grant Family Ranches

(31) Regents of California sold property and water rights to WH Ventura 165 LLC

(32) Hampton Canyon Ranch Sold property and water rights to Torres, George 2013 Turst, 21.9 acre-feet

(33) Albert Kimura sold property and water rights to 18004 Telegraph Road Properties, LLC 37.5 acre-feet

(34) Silva allocation of 108.6 Acre-Feet was distributed to County of Ventura 47.3

(35) Silva allocation of 108.6 Acre-Feet was distributed to Riverpark A LLC 16.2

(36) Silva Allocation of 108.6 Acre-Feet was stributed to Jakran IV LLC 45.1
